

Cassandra Day
2022

Stargate – An OSS API Layer for Cassandra

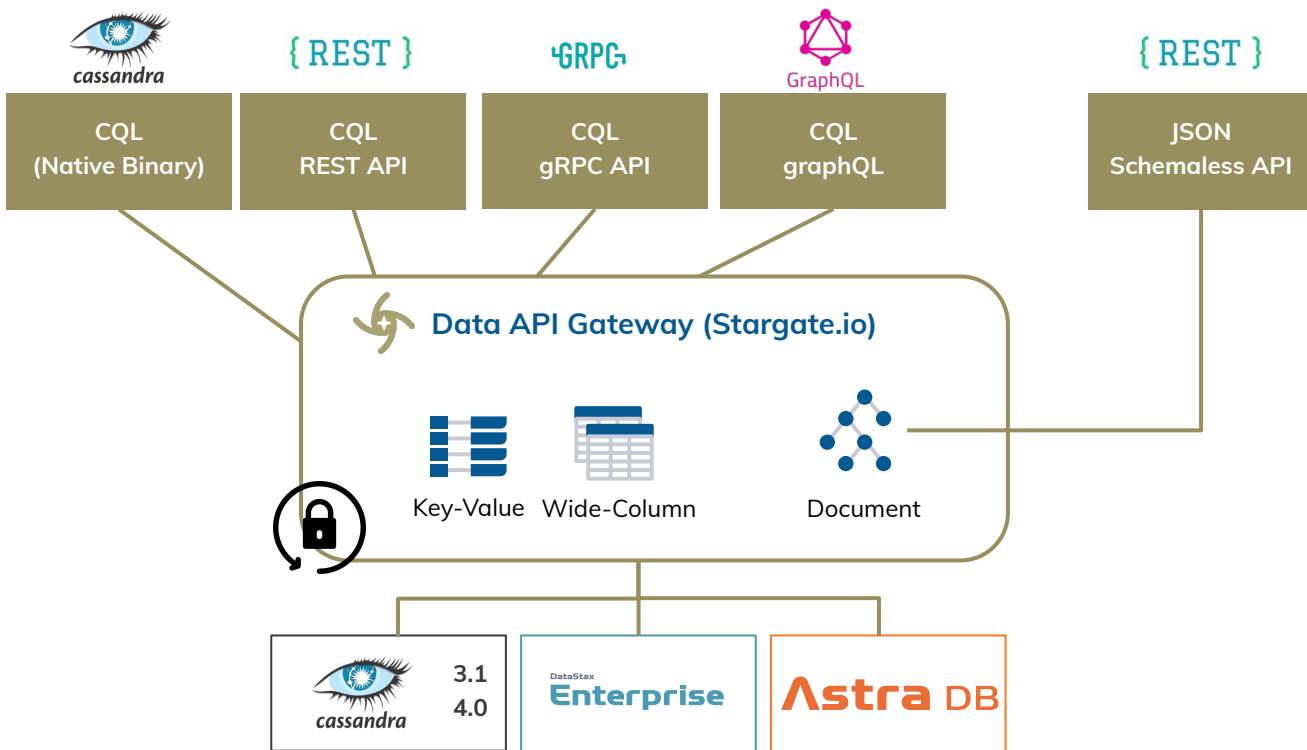

Sponsored by DataStax

What is Stargate ?

- Data API gateway
- Sits between applications and Cassandra
- Translates API calls into CQL
- Extensible, open source project on GitHub
- Apps/microservices can use more than one API

Stargate Data Gateway

Operators

Shield developers from tight coupling of applications to databases

Drop in scale and performance tuning flexibility for Apache Cassandra

Deploys to anything and is K8s native

Developers

Easily connect apps, functions, services over HTTP across a range of use cases

JSON Document DB without having to use another DBMS platform/design

Upgrade default Cassandra security

Ecosystem

Extend Cassandra/Stargate to the APIs and data serialization formats you need

Transparent discussion and community support for ecosystem developers

API Compatibility for other DBMS, ORMs

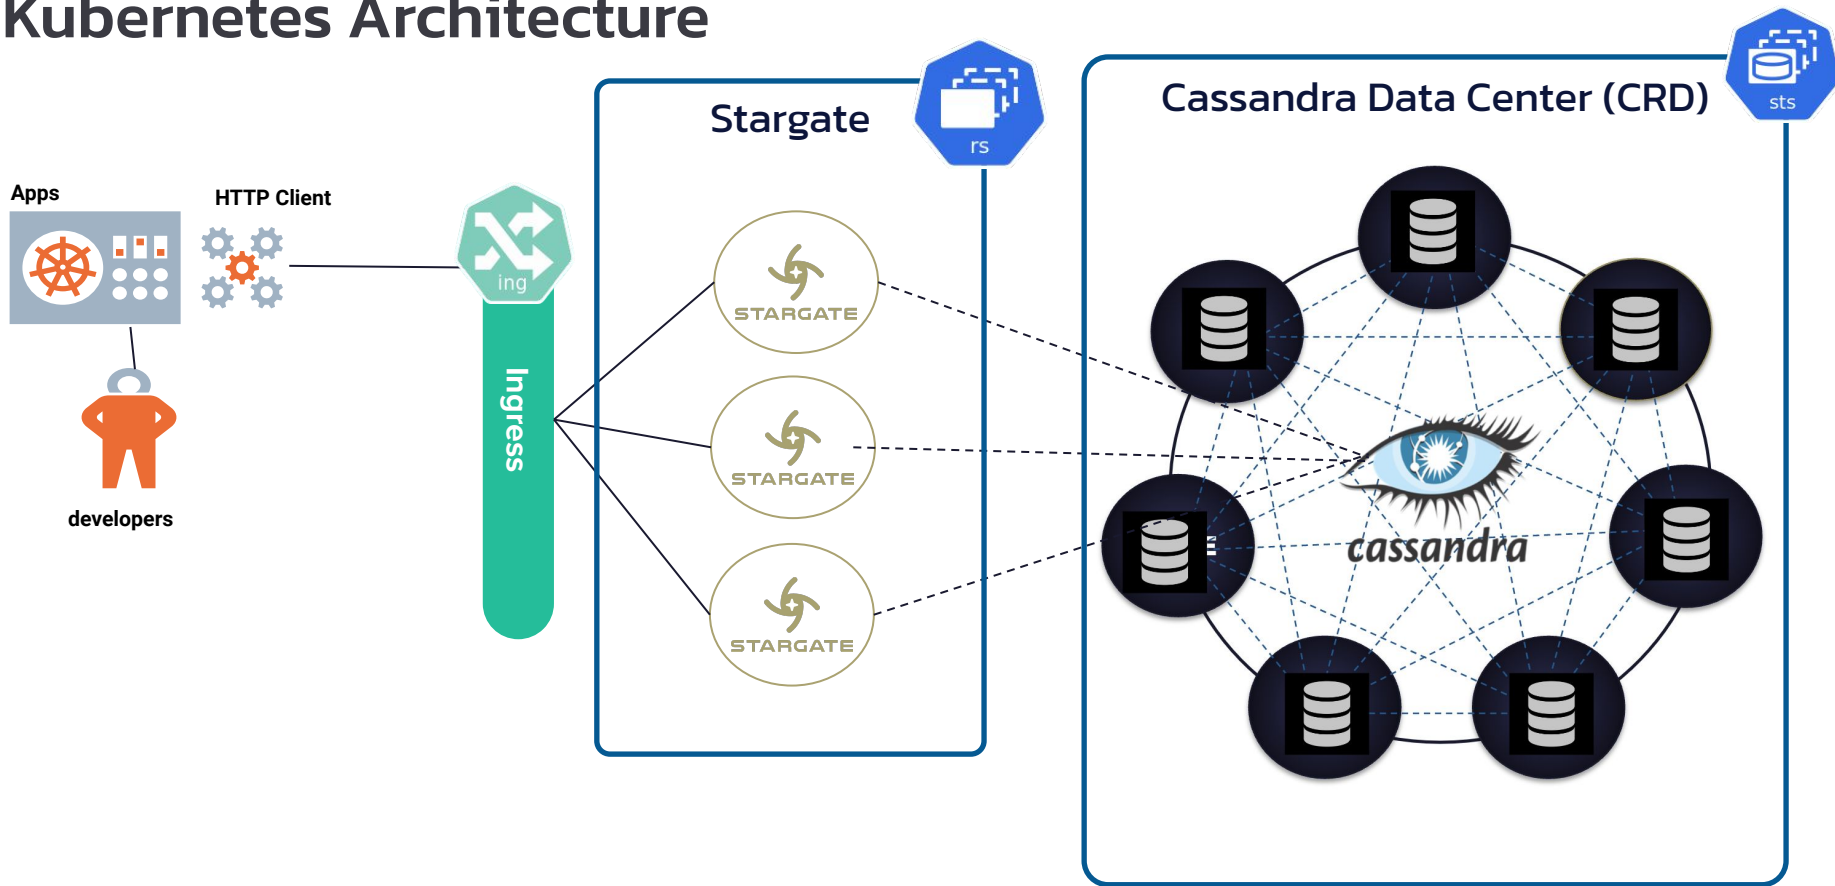

Architecture

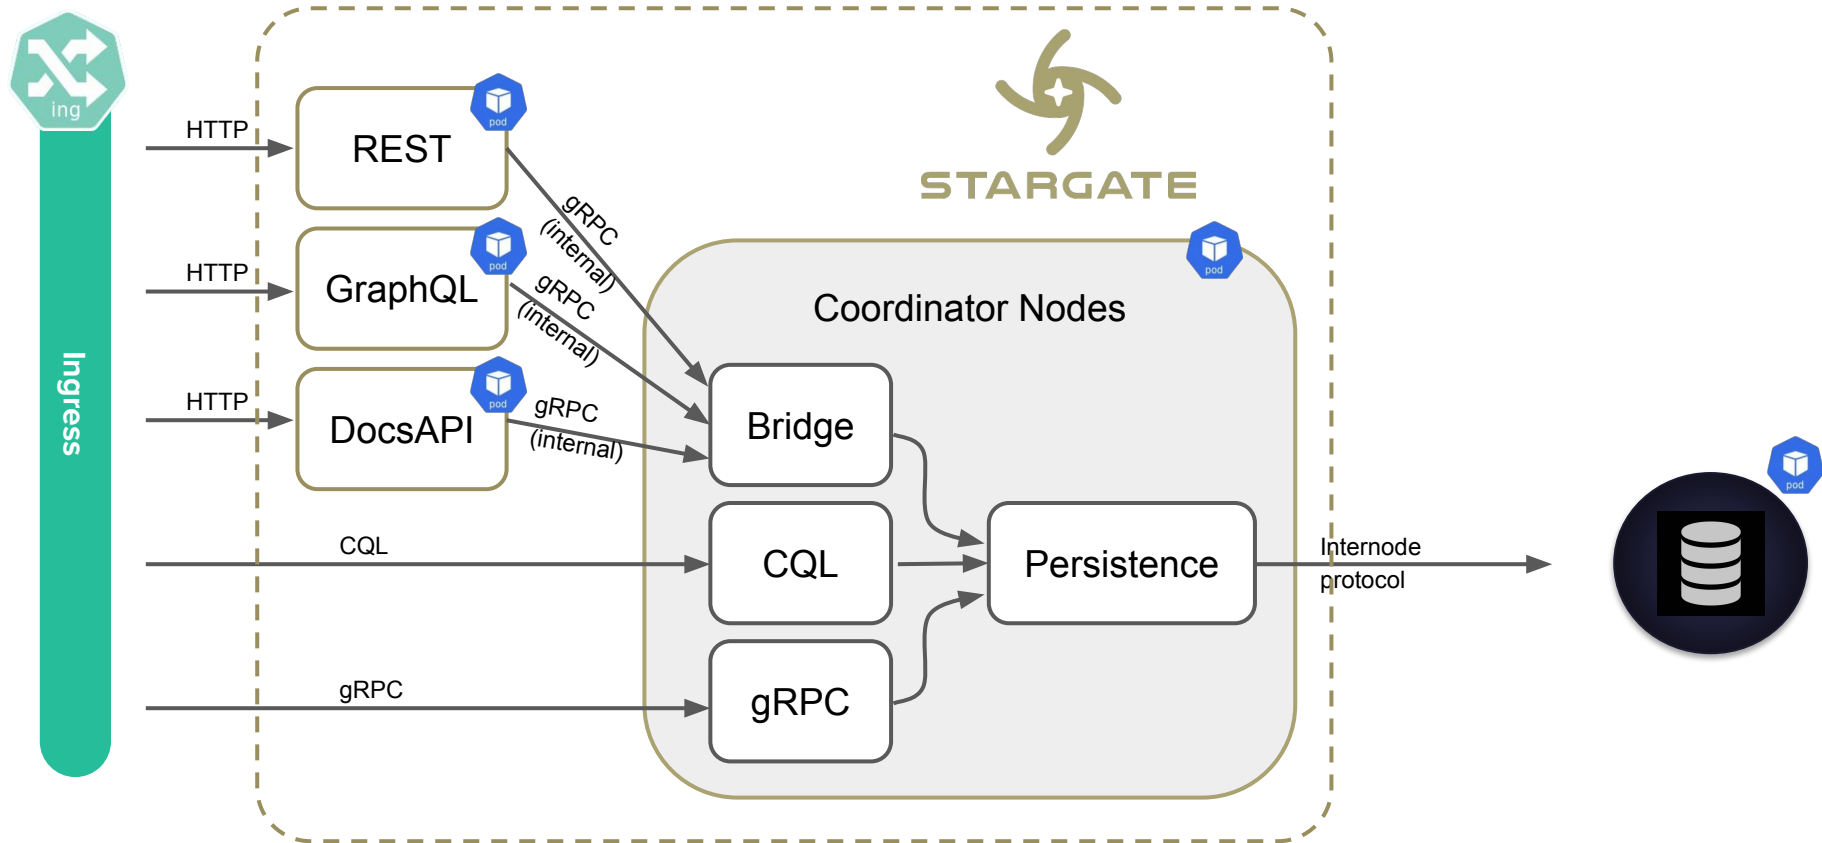

Architecture with Stargate

Kubernetes Architecture

Kubernetes Architecture (bis)

Authentication

- Use Auth and get tokens (user+pwd)
- Tokens shared across instances
- Leverage on Cassandra roles (RBAC)
- `-Dstargate.auth_tokenttl =X`

```
curl -L -X POST 'http://localhost:8081/v1/auth' \
  -H 'Content-Type: application/json' \
  --data-raw '{
    "username": "cassandra",
    "password": "cassandra"
  }'
```

CQL Native Drivers

Exposes native Cassandra
Query Language (CQL) syntax

Uses same CQL syntax, tools and
native language drivers

Used with DataStax official drivers for
developing applications in any language

Can also be used with standalone
cqlsh using Docker

Highest performance way to use
Cassandra

CQL REST API

Greater flexibility and faster development

Schema

The Schema API allows you to interact with keyspaces and tables in your database

Data

The Data API allows you to add, update, read and delete rows in your database

Supports verbs - Create, Read, Update, Delete

Stargate Rest Api

Cassandra as a Web API

{REST}

GET	/v2/schemas/keyspaces/{keyspaceName}/tables/{tableName}/columns	Get all columns
POST	/v2/schemas/keyspaces/{keyspaceName}/tables/{tableName}/columns	Create a column
GET	/v2/schemas/keyspaces/{keyspaceName}/tables/{tableName}/columns/{columnName}	Get a column
PUT	/v2/schemas/keyspaces/{keyspaceName}/tables/{tableName}/columns/{columnName}	Update a column
DELETE	/v2/schemas/keyspaces/{keyspaceName}/tables/{tableName}/columns/{columnName}	Delete a column
DELETE	/v2/schemas/keyspaces/{keyspaceName}/tables/{tableName}/indexes/{indexName}	Drop an index from keyspace

GET	/v2/keyspaces/{keyspaceName}/{tableName}/rows	Retrieve all rows
GET	/v2/keyspaces/{keyspaceName}/{tableName}	Search a table
POST	/v2/keyspaces/{keyspaceName}/{tableName}	Add row
GET	/v2/keyspaces/{keyspaceName}/{tableName}/{primaryKey}	Get row(s)
PUT	/v2/keyspaces/{keyspaceName}/{tableName}/{primaryKey}	Replace row(s)
DELETE	/v2/keyspaces/{keyspaceName}/{tableName}/{primaryKey}	Delete row(s)
PATCH	/v2/keyspaces/{keyspaceName}/{tableName}/{primaryKey}	Update part of a row(s)

GET	/v2/schemas/keyspaces/{keyspaceName}/tables/{tableName}/indexes	Get all indexes for a given table
POST	/v2/schemas/keyspaces/{keyspaceName}/tables/{tableName}/indexes	Add an index to a table's column
GET	/v2/schemas/keyspaces/{keyspaceName}	Get a keyspace
DELETE	/v2/schemas/keyspaces/{keyspaceName}	Delete a keyspace
GET	/v2/schemas	Get all keyspaces
POST	/v2/schemas	Create a keyspace
GET	/v2/schemas/keyspaces/{keyspaceName}/tables/{tableName}	Get a table
PUT	/v2/schemas/keyspaces/{keyspaceName}/tables/{tableName}	Replace a table definition

CQL gRPC Api

CQL access from any language, no driver required

Alternative to native drivers

Faster than other HTTP APIs

Lighter weight than native drivers

Easier to learn, maintain, and update than native drivers

Clients fully supported by DataStax:

Java

Go

Node.js

gRPC, High performance with Stargate

Cloud Friendly

Cloud friendly HTTP makes networking easy, without sacrificing native driver performance

Empowers developers

Reduce the need to learn network operations just to configure a driver

More connectivity options

gRPC makes it easier for DataStax and customers to generate clients in any language

Accelerate time to market

CQL GraphQL API

Make queries fast, flexible and
client-friendly

**Developer can pick exact data the client
UI needs**

**Reduce number of queries by retrieving
all relevant data from a single endpoint**

GraphQL objects generated for every table

Queries - Read data

Mutations - insert and modify data

Schema API

Create/drop table

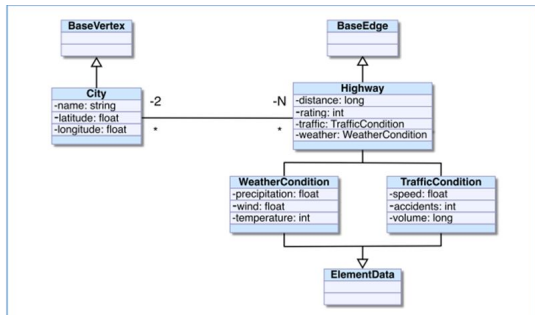

Create/delete schema

Query API

Querying and modifying table data using Graph fields

Stargate Document API

Cassandra as a Document Oriented DB

- Cassandra already handles both **JSON** and **nested objects**
 - INSERT JSON, SELECT JSON
 - Set<>, List<>, Map<>, and User Defined type (UDT) even nested
- But...
 - Strongly coupled with a SCHEMA VALIDATION
 - Dangerous with tombstones on updates

```
select json title,url,tags from videos;
```

```
INSERT INTO videos JSON '{
  "videoid":"e466f561-4ea4-4eb7-8dcc-126e0fbfd578",
  "email":"clunven@sample.com",
  "title":"A JSON videos",
  "upload":"2020-02-26 15:09:22 +00:00",
  "url": "http://google.fr",
  "frames": [1,2,3,4],
  "tags":  [ "cassandra","accelerate", "2020"]
}';
```

Stargate Document API

Cassandra as a Document Oriented DB

"What rules ?"

"SCHEMALESS !"

- You want to insert and retrieve any JSON documents efficiently
- Allow "schemaless" (Validation-less)
- Write to a single document is a single batch of statements
- Read from a single document is a single SELECT statement.
- Limit Tombstones with range deletes

Document API

Save and search schemaless JSON documents without data modeling

Store JSON documents and automatically create schema

Fetch all documents in the collection

Fetch full-document or sub-document

Update a section of the document without reading the entire document

Fastest way to get to market

Stargate Document API

Cassandra as a Document Oriented DB

```
create table <name> (
  key text,
  p0 text,
  p[N] text,
  bool_value boolean,
  txt_value text, d
  bl_value double, leaf text
)
```

```
{"a": { "b": 1 }, "c": 2}
```

For data with an array, such as:

```
{"a": { "b": 1 }, "c": [{"d": 2}]}
```

there would be two rows, like so:

key	p0	p1	p2	dbl_value
x	a	b	null	1
x	c	[0]	d	2

The document would be “shredded” into rows looking like this:

key	p0	p1	dbl_value
x	a	b	1
x	c	null	2

Stargate Api Overview

Cassandra Query Language

Document !

Cassandra Query
Language

SQL like Table Model
Structured Data
Key-Value Data
Strong Types
Minimal query overhead

gRPC

Structured Data (CQL)
Lighter weight
Native driver alternative
Low query overhead

GraphQL

GraphQL

Hierarchy of
types and fields
Structured Data
Key-Value Data
Low query overhead

{REST}

REST

Row based
Structured Data
Key-Value Data
Weaker Types
High query overhead

Document

JSON Documents
Semi-Structured Data
Weaker Types
High query overhead

More Performant

More Flexible
